5. EXPERIMENTS ON PACKET CAPTURE TOOL : WIRESHARK

Aim:

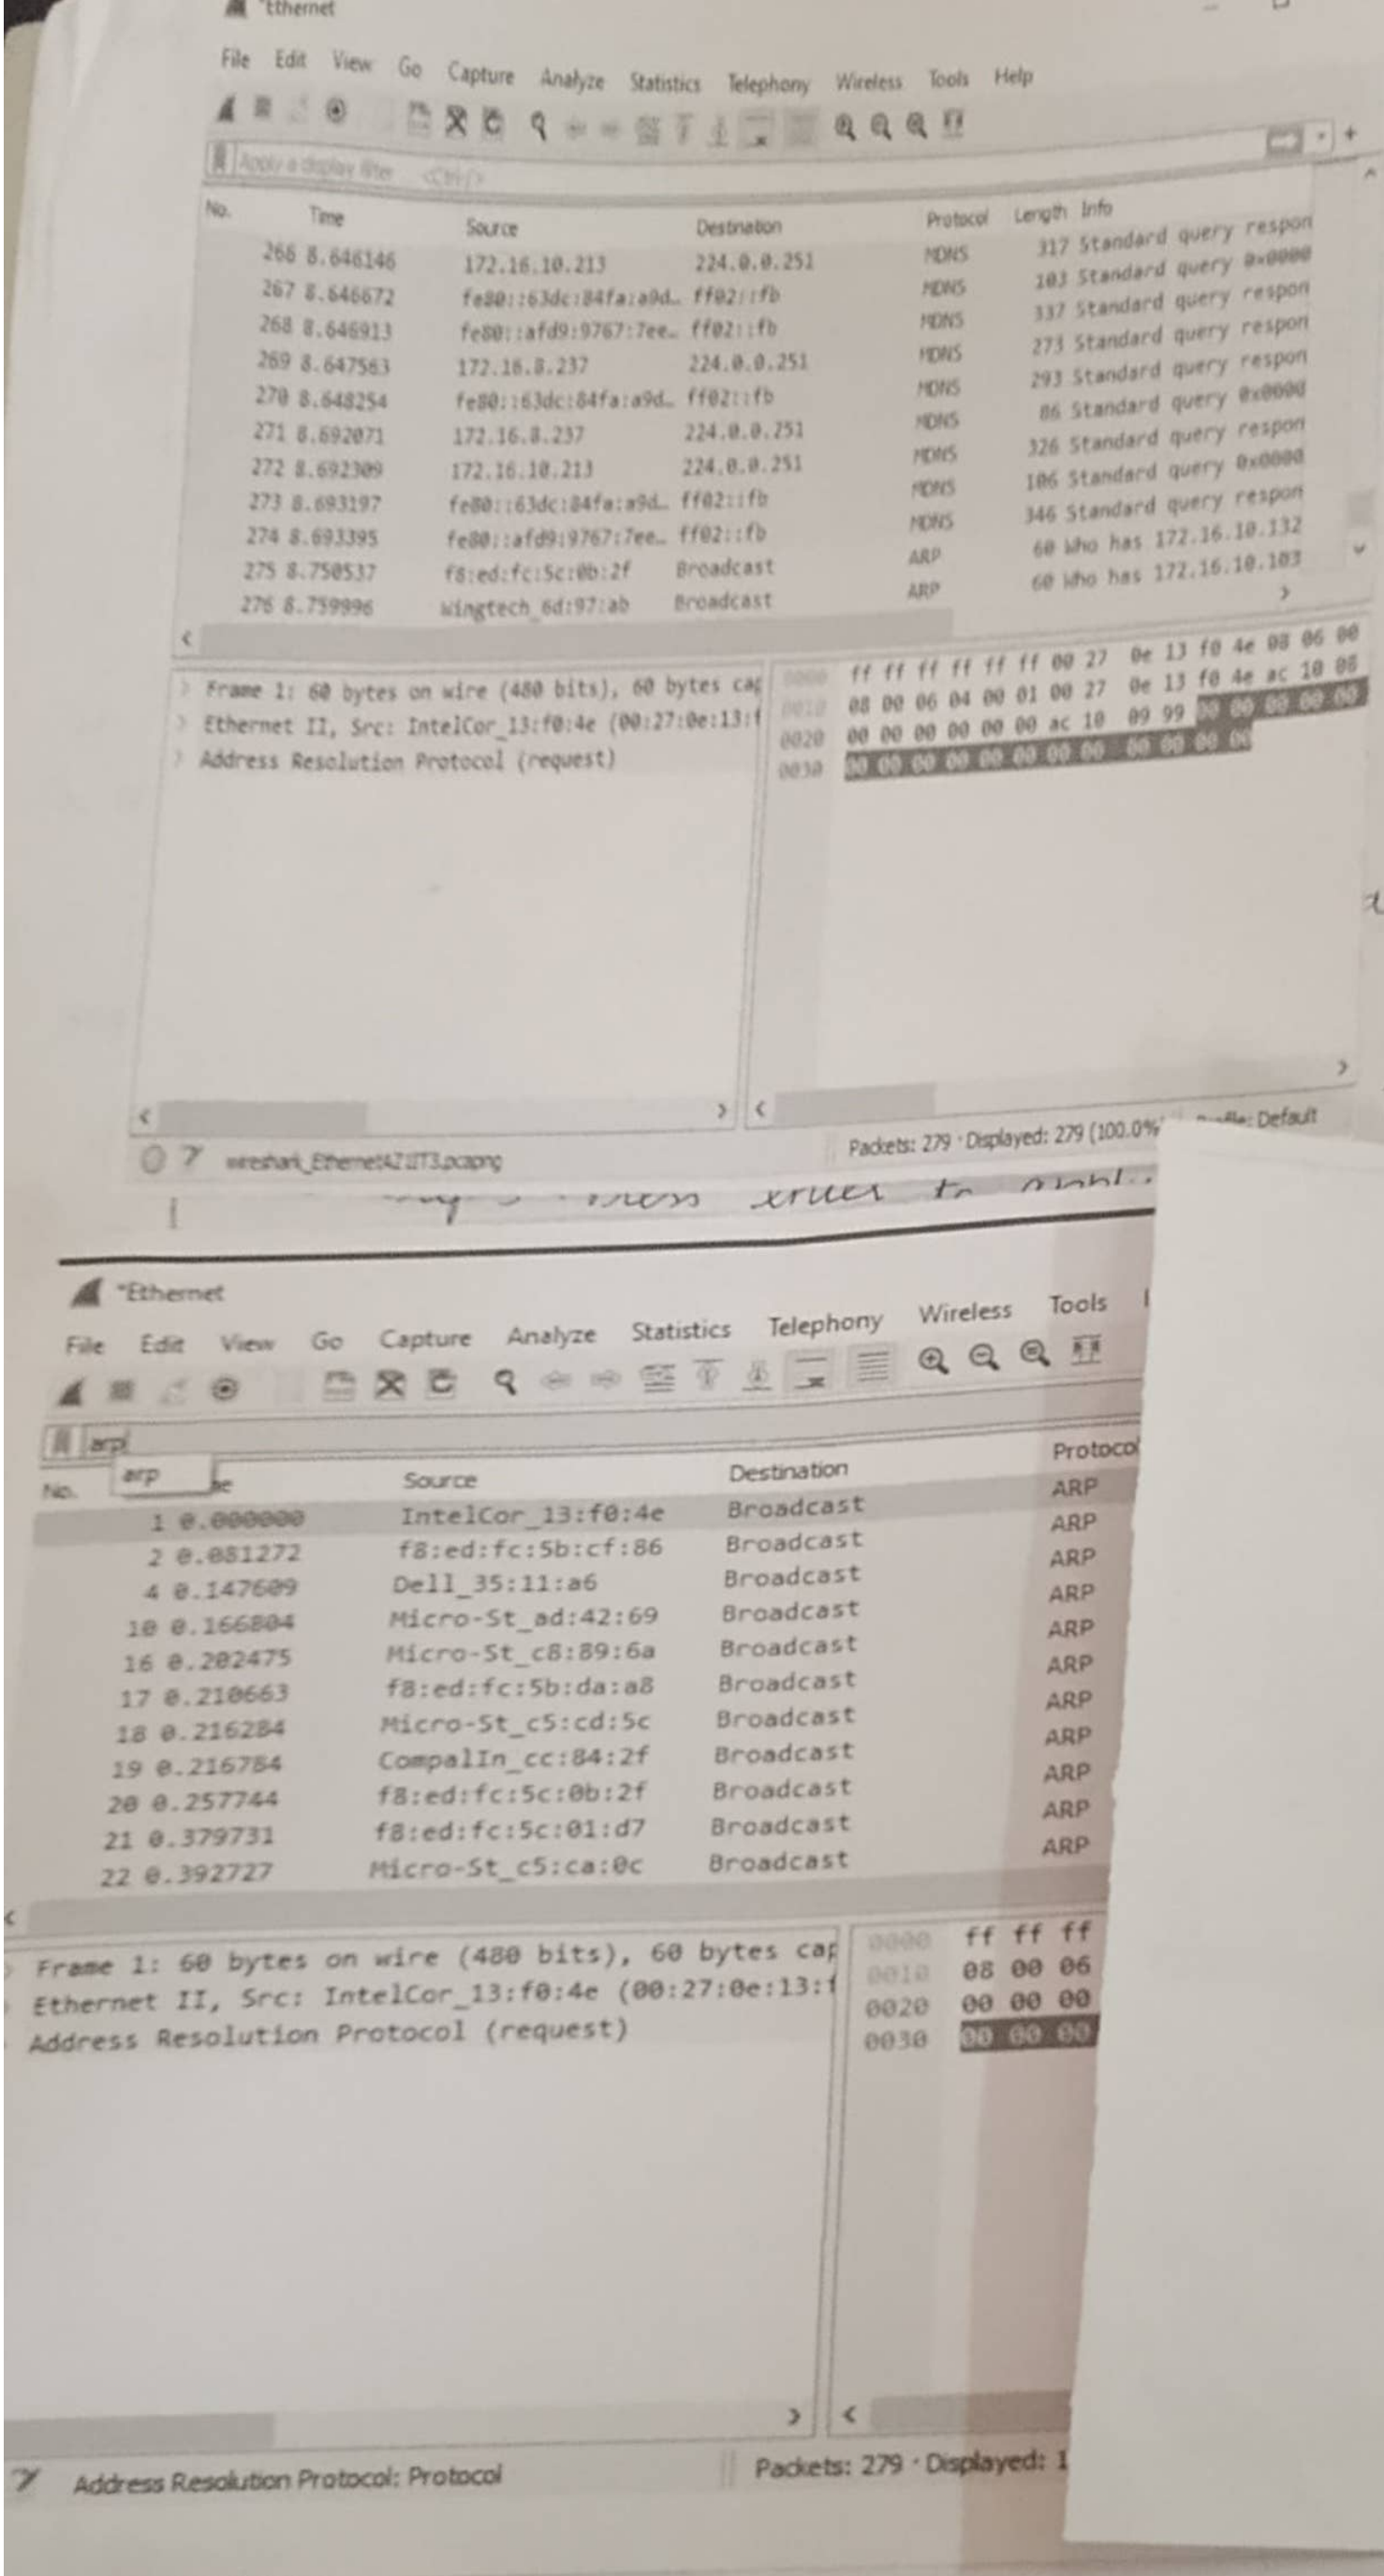

To capture and analize network packets using the wireshark packet capture tool and apply filters for TCP, UDP, DNS, HTTP, etc.

Wireshark:

Wireshark, a network analysis tool formerly known as Ethereal, captures packets in real time and display them in human-readable format. Wireshark includes filters, color coding, and other features that let you dig deep into network traffic and inspect individual packets. You can use Wireshark to inspect a suspicious program's network traffic, analyze the traffic flow on your network, or troubleshoot network problems.

Capture the packets:

step 1: Open the wireshark application
step 2: Select the active network interface such as wifi or Ethernet.
step 3: Double-click the selected interface to start packet capturing.
step 4: Observe the packets appearing in the packet list pane.
step 5: Allow wireshark to capture packets for a few seconds.
step 6: Click the stop button to stop packet capturing.
step 7: Observe the captured packets and their details.
step 8: Save the captured packets using File → Save as.
step 9: Take a screenshot of the captured packets.

ocol.

The network packets were successfully captured an
saved using wireshark. The captured packets were succ
filtered based on different protocols.
